Colletotrichum is one of  
the most widespread and  
important genera of plant  
pathogenic fungi  
worldwide, causing  
disease on many  
temperate and tropical  
crops. These fungi have  
also been used in many  
fundamental studies of  
plant-pathogen  
interactions and are being  
developed as

mycoherbicides for the biological control of weeds.

### **Colletotrichum: Biology, Pathology and Control (Cabi)**

Colletotrichum lindemuthianum is a fungus which causes anthracnose, or black spot disease, of the common bean plant (*Phaseolus vulgaris*). It is considered a hemibiotrophic pathogen because it spends part of its infection cycle as a

biotroph, living off of the host but not harming it, and the other part as a necrotroph, killing and obtaining nutrients from the host tissues.
